Open Work Visa (PGWP) in Toronto, ON

Education

- Advanced Diploma, Computer Programming & Analysis, Seneca Polytechnic Aug 2026

Work History

Software Developer (Contract), Villen Technologies - Remote *Jun 2026 - Present*

- Developed an AI job-matching service that reads resumes, finds relevant job listings, and shows fit scores with explanations.
- Reduced processing time for resume parsing, job search, and fit scoring from approximately 3 minutes to 3 seconds by replacing sequential LLM matching calls with embedding-based matching and rule-based checks.
- Migrated 14 API routes from Vercel to Firebase Cloud Functions to adopt the company's preferred platform, and built a GitHub Actions CI/CD pipeline with automated test checks and deployment.
- Implemented Zod validation for required fields and score ranges, retried malformed responses and recoverable errors, and displayed an explanatory message when API usage limits were reached.
- Moved API keys into Secret Manager and added Redis-backed request limits per user and IP address to restrict excessive requests.
- Closed an XSS vulnerability in source-link rendering by validating backend-provided URLs and allowing only HTTP(S) schemes.
- Added Sentry error monitoring and structured Pino logging across 12 route handlers to support production failure detection and debugging.

Freelance Software Developer - Toronto, ON & Gyeonggi-do, KR *Jun 2025 - Jun 2026*

- Delivered web and mobile applications for cafe staff, customers, and students using React, TypeScript, PostgreSQL, and Flutter.
- Built a Supabase/PostgreSQL admin portal with separate administrative access so cafe staff could update prices without developer assistance.
- Developed a customer-facing storefront in React and TypeScript for a cafe serving approximately 1,000 customers weekly.

- Delivered a Flutter classroom application used by approximately 150 students, implementing teacher-defined accessibility requirements to support independent navigation.

Projects

Fragments Microservice | *Node.js, Express, AWS, Docker*

- Built a Node.js and Express REST API service on AWS that lets users sign in, save small pieces of data, and retrieve them later.
- Restricted API reads and writes to each authenticated owner and configured scoped IAM permissions for S3 and DynamoDB to limit access to stored data.
- Containerized the service with Docker and automated builds, tests, and deployment through GitHub Actions, requiring tests to pass before deployment

JobMatch | *TypeScript, Next.js, Node.js, OpenAI API, Zod*

- Built a TypeScript and Next.js application that helps users tailor resumes and assess job fit using the OpenAI API.
- Validated AI responses with Zod and automatically retried invalid outputs to reject malformed model data.
- Used the OpenAI API to automate resume tailoring and job matching, with processing times under one minute.

SmartStock | *TypeScript, Next.js, Tailwind, Flask, JWT*

- Built an inventory application in a four-person Agile team using Next.js, Tailwind, and a Python Flask REST API.
- Developed the inventory application's frontend with Next.js and Tailwind, integrating it with the Flask REST API.
- Implemented JWT-based role checks and protected application routes to restrict access according to user permissions.
